

Need Verge Dock-Pro gates installed? We are here to help you!

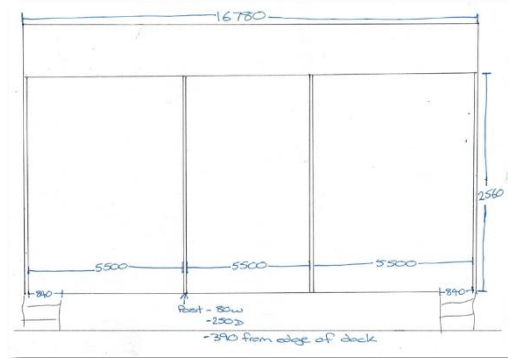

How to measure up your loading dock in 4 simple steps!

## 1. Draw up the loading dock as is. (a rough sketch will do)

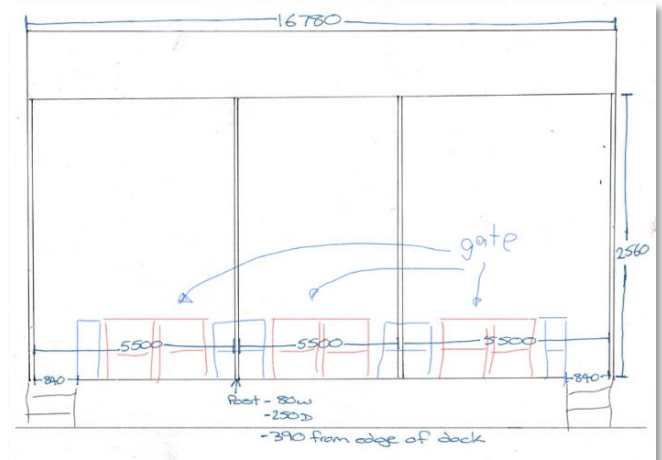

(if this is too difficult, just get the overall measurement and go to step 3)

- Get an overall measurement of the dock edge. If there is structural columns or infrastructure along the dock edge record the location/s on the drawing.
- Check clearance height. Record measurement of lowest point.
- If dock has dock-levelers include them on the drawing

## 2. Sketch the approximate locations of where you'd like the dock openings/gates to be installed.

- Mark where you would like the gate/s and where it should be permanent handrail.
- *Please note: the measurement accuracy of the gate/s are not critical for quoting purposes.*

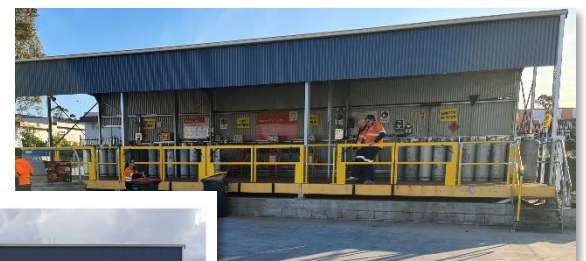

## 3. Photograph it!

- Stand on the lower level, square on to center of dock area, back far enough (10-20m) to get the full dock area in the photo.
- Take additional photos from the left and right side, and a photo from standing up on the dock.

## 4. Submit it and request a quote.

- Compile drawings, measurements and photos and submit it online or email it to [sales@verge.com.au](mailto:sales@verge.com.au). Please provide the site address, and your contact details so our team can be in touch should we have further questions. Also, let us know if you would like us to do the install. All the best! 😊
